Nairobi, Kenya · dreamteamconsult@gmx.com · +254 718 554 383 · dreamteamea.com

R10 is R9 after the morning of 4 November: the assistant in the corner of every page became a real conversation. Amanda matches the lane a client names, computes kilometres, borders, transit and a cost-plus road rate from the engine tables in the Worker, and hands those to Muse Spark as the only figures it may use — so the number is computed before the model speaks. She is labelled Ask Amanda, Powered by Meta, and sits on the React desk and on the two plain-HTML pages alike.

The same morning found a defect worth naming: the endpoint was in the deployed bundle and answered 405 on the live site, because run_worker_first is an allowlist and /api/amanda was not on it. Fixed, and a test now reads wrangler.jsonc so the next endpoint cannot repeat it. 557 assertions stand behind this build.

R11 adds the growth programme Mr Allan set in the pipeline on the morning of submission: social handles, social marketing, Meta and WhatsApp advertising, Google Ads and SEO, in a fixed order that starts with measurement and organic baseline before a shilling is spent.

R12 closes the loop a judge actually walks: the assistant takes a typed question, a spoken voice note and a photograph of cargo or a document, and answers each from the same computed facts. Live video is by authentication — the CTO joins by appointment — and the panel says so rather than implying a call is ringing. The lane lookup also composes corridors from the engine's own road legs, so Mombasa to Kigali answers with 1,695 km and two borders instead of "I have no figures". 562 assertions stand behind it.

0D. WHAT THE MARKET MEASURES (the sizes this desk is built against)

Kenya's revenue leakage, three independent methods, all read from the published documents on 3 November 2026:

- Global Financial Integrity, Kenya trade misinvoicing (2018 report, 2013 trade year): potential revenue loss US$907 million, about 8 per cent of total government revenue. The largest component is import under-invoicing, US$2.0 billion, nearly 17 per cent of the imports analysed.
- The same body over 2002-2011 (Hiding in Plain Sight, 2014): US$3.92 billion cumulative, US$435 million a year, 8.3 per cent of government revenue. Uganda 12.7 per cent, Tanzania 7.4 per cent on the same method.
- National Taxpayers Association with Oxfam (policy brief, September 2025): the import value gap rose from KES 1 billion (0.24 per cent) in 2016 to KES 180 billion (19.81 per cent) in 2024; KES 711 billion over nine years, 7.9 per cent on average. Illicit goods deny the exchequer KES 153 billion a year, 6 per cent of total taxes; VAT lost to invoices without goods about KES 4.5 billion a month.

What the small trader pays is measured as extraction, not as a tax rate:

- Sauti Africa at Busia and Malaba (2017): 81 per cent of cross-border traders met corruption or harassment in the previous month, more than 50 per cent in the previous week. Police 59 per cent of it, revenue officials 18 per cent, middlemen 12 per cent, clearing agents 10 per cent. Only 13.5 per cent ever reported it. The report names the cause as information asymmetry between traders and officials about procedure and duties.
- ICRW (2019): 22.7 per cent of women-owned businesses in Kenya, Tanzania and Uganda were asked for an informal payment at a tax inspection, against 14 per cent of men-owned.

Capacity that earns nothing:

- Northern Corridor Transport Observatory (2025): 55 per cent of sampled trucks were loaded, so 45 per cent of all vehicle-kilometres run empty; about 45 per cent of trips are empty.

DREAMTEQ CONFIDENTIAL

- International Transport Forum (OECD), citing the same survey: 45 per cent empty returns in the region against 20 per cent in Europe and the United States, and trucks moving for only about 36 per cent of total travel time.

What this desk may and may not claim:

- It may claim that the duty band, the CIF boundary and the price are computed and shown before the truck moves, so the number does not have to be guessed at a barrier, and that an empty return is matched rather than wasted.
- It may not claim a saving per trader or per truck. No credible published figure says small traders are over-taxed by a given percentage; that is a pilot measurement and this sheet does not invent one.

Then: project name Altovex CargoLinx; tagline from section 2; description from sections 3–7; evidence from section 9.

0B. THE NINETY-SECOND TEST (paste near the top of the description, if there is room)

Open https://altovexcargolinx.allansande74.workers.dev on any phone or laptop. Three sample jobs are already on the desk, labelled as sample data, so nothing has to be typed before the first result.

1. New shipment -> "Choose File" beside INTAKE, and attach any PDF rate card or packing list. The file is opened on your own device and never uploaded; only its words go to the model. Seconds later the desk note carries what the card says, with the model that read it named underneath.
2. In the same card, attach a photograph of the cargo and press "Count cargo from photo". The count is the boxes the model segmented, not a sentence about them.
3. Press "Record voice note", speak, then "Stop and transcribe". The transcript lands in the desk note; "Read the note into fields" turns it into shipment fields.
4. Quotes & pricing -> "Explain this quote". One paragraph, in the customer's words, using only the figures printed above it.
5. Export desk -> take a job you have already carried, read it the other way, and follow the corridor on to Shanghai. On a CIF term the quote says where our obligation ends and where the importer's begins.
6. Any page, corner button: Ask Amanda (Powered by Meta). Ask "Quote DDP Nairobi to Kampala for 27 tonnes of rice". The lane, 700 km, one border, USD 1,880 a truck and USD 69.63 a tonne come back — computed in the Worker from the lane tables, then written up by Muse Spark, which is given those figures as the only numbers it may use. Ask a second question and she keeps the thread.
7. Hold the microphone button and speak the same question. The recording is turned into 16 kHz audio in the panel, transcribed by Meta's speech model in the Worker, and the transcript is shown back to you — so a mis-hearing is visible rather than silent. The answer carries the same computed figures.
8. Photograph a carton or a document and send it. She looks at the picture and says what she can see and what it changes about the shipment. A video is read as a single frame and the reply says so. Live video is by authentication: the CTO joins by appointment, and the panel says that rather than pretending a call is ringing.
9. Ask "How long does Mombasa to Kigali take?" A corridor the lane table never named comes back composed from the engine's own legs — 1,695 km, two borders, through Kampala — because the desk runs that road weekly and refusing to answer it would be the wrong kind of caution.

The same seventy seconds, filmed on the live site today:
https://allansande74-design.github.io/cargolinx/demo/CargoLinx-demo-3Nov2026.mp4

The seven models, working together on one screen (Workspace -> Intelligence):
https://altovexcargolinx.allansande74.workers.dev/#/desk/intel

The record behind this sheet, with its own digest and QR:
https://allansande74-design.github.io/cargolinx/verify/?id=DTQ-CLX-SS-2026-11-03-R10

0C. WHERE EACH CRITERION IS SCORED

PERMIT CONFIDENTIAL

Impact (30)	Sections 3-5 and the corridor in section 9: Kampala to Mombasa 1,185 km over one border, then 5,877 nautical miles to Shanghai. Three live client conversations sit behind that corridor - chilli pepper aggregated from farms in two countries for processing and export to China, arabica coffee from eastern Uganda, and Ugandan fish and fish offal. None of them is counted here as revenue.
Meta tooling (25)	Section 10: seven models in daily use behind real buttons, and three generations of one model asked the same question at the same instant, judged blind by a fourth; a same-origin gate that holds the only key; an allowlist, a per-call token cap, per-address rate limiting, and the two contributor models refused by policy and named as refused. The client-facing assistant reuses that same gate: one key, same origin, no key in the browser, and computed figures handed to the model rather than asked of it.
Demo (25)	Section 0B above, and the 69-second film it links to: dead waits compressed to a flash, every result left on screen, and a closing card that says what to do next.
Technical depth (20)	Section 9: 557 assertions; routing proven optimal at six and eight stops and 14.7% shorter at forty; a cost engine that refuses to guess a duty band and says so in words; an assistant whose every figure is computed before a model is allowed to speak about it.

Stage: the platform MVP is live on the public internet today — desk, pricing engine, tracking, export desk, intelligence screen and the assistant. It moves to full commercial state after this stage: client accounts and the portal, live carrier and port feeds, the CRM behind the assistant, and the WhatsApp channel opened to the public number.

0D. WHAT FOLLOWS THIS STAGE: THE GROWTH PROGRAMME

Stated here because the honest question about any hackathon build is what happens the week after the film stops. The full register sits in the pipeline file; this is the order.

1. Social handles, one consistent name per platform, each profile and its copy approved before it is published. The contact page marks them "being set up" until that day, so no dead link is ever offered to a client.
2. Measurement and SEO foundations first: analytics, search console, a conversion on every quote request, corridor pages carrying the real distances and transit times this engine already computes.
3. Four weeks of organic content to establish a baseline that can be argued with. Corridor facts, rate movements, clearing documents, matched-load wins. No client name, rate, margin or photograph without written consent.
4. WhatsApp Business profile with catalogue, greeting and away messages; the assistant answers first and hands to a person on request; the opt-in list grows from real enquiries only, never a purchased list.
5. One small Meta click-to-WhatsApp campaign on one corridor, measured per booked job.
6. Google Search on the terms that already carry intent - freight forwarder Nairobi, clearing agent Mombasa, DDP Uganda, customs clearance Kenya. Performance Max only after Search has a baseline to beat.
7. Scale what produced booked jobs. Stop what produced clicks.

Guards, permanent: no campaign, no spend and no published post without Mr Allan's approval of that specific copy, audience and budget; no invented statistics in any advertisement; cost per qualified enquiry is the only score that counts, and impressions are not a result.

No budget figure is printed on this sheet. None has been sized, and a made-up number would be exactly the kind of claim this pack exists to avoid.

0E. WHO OWNS THIS, AND WHAT THE RESOURCES WOULD DO

CargoLinx is owned and operated by Altovex Global Logistics, part of the Dreamteam Consulting group. The group's digital ecosystem — this freight desk and the agric and trade platforms behind it — runs in production today.

Winning this hackathon's resources would go into completing, operationalising and commercialising

DREAMTEQ CONFIDENTIAL

that ecosystem, with a target of one million users in five years. That figure is the founder's stated target, not a measured forecast, and it is labelled as such here so no judge is asked to take a projection for a result.

The same statement is published on the site — the landing page footer, the contact page and the hackathon page — because a judge should not have to read a PDF to learn whose platform this is.

1 DEADLINE

Official, from the hackathon's own page: "Nov 4 — Project submissions due by 9:00 PM ET." That is 05:00 EAT on Thursday 5 November.
Source: https://dev.meta.ai/events/global-hackathon (checked 3 Nov 2026).
We still submit to Mr. Allan's own buffer, Wednesday 4 November 12:00 EAT.

2 ONE-LINE PITCH

FORM TAGLINE
Offline-first freight desk: one delivered-duty-paid price from load port to doorstep for imports into and across Africa, calculated on a phone with no network.

PROJECT DESCRIPTION
CargoLinx is an offline-first freight desk for international trade into and across Africa. From Shanghai, Ningbo, Shenzhen, Nhava Sheva or Jebel Ali it prices a consignment through to the African discharge port and on to the door — sourcing, sea freight, duty and levies, VAT, clearing, inland transit and last mile — as one delivered-duty-paid figure, calculated on a phone with no network, then follows the consignment to the day it lands.

The price is firm, not indicative: it carries a validity date and is issued on a document whose arithmetic the customer can check back to the published rate.

Scope, counted from the engine this morning: five load ports (Shanghai, Ningbo, Shenzhen, Nhava Sheva, Jebel Ali) and eight African discharge ports (Mombasa, Dar es Salaam, Beira, Durban, Walvis Bay, Maputo, Tema, Lagos) — thirteen ports in all, on twenty sea lanes, with four priced inland corridors, three of them crossing a border.

An export is priced by the same engine read the other way: a load already carried into Nairobi is read backwards to Mombasa and followed on to five Chinese ports — Shanghai, Ningbo, Shenzhen, Guangzhou, Tianjin — 5,877 nautical miles and 15.3 days at sixteen knots on the Shanghai lane, computed from port coordinates and a routing allowance rather than copied from a carrier. The quote is issued CIF to a named Chinese port: risk passes on board at Mombasa, cover is Institute Cargo Clauses (C) at 110% of invoice value, and the importer takes clearance, any Chinese duty and VAT, port charges, inland processing and the last mile. Chinese duty is not quoted because no Chinese tariff is held. There is still no export-duty model in the engine, and this entry does not claim one.

DREAMTEQ CONFIDENTIAL

3 THE PROBLEM

A small Kenyan freight forwarder quotes a cross-border job by hand: duty rates from memory, freight from an old spreadsheet, a margin guessed under pressure.

- Quotes take hours, so the forwarder loses the job to whoever answers first.
- Duty and levy errors are found by the customer, not the desk.
- Nothing works when the network drops, which on the Northern Corridor happens frequently — at the ICD, at the border, in the yard.

The customer sees a number and a promise. Nobody can show the working.

4 WHAT WE BUILT

A desk that runs entirely in the browser, in four parts:

QUOTE	Landed-cost ladder from dated statutory rates: goods, freight, duty, levies, clearing, transport, last mile, VAT. Every line is attributable to a published rate and the date it was read.
DOCUMENTS	Quotation, delivery note, packing list and invoice generated in the browser and printed from there — no server round trip, nothing re-typed, and every statutory line traceable to the rate behind it.
CORRIDORS	Four routes priced live from the same engine — Mombasa–Kampala, Nairobi–Kampala, Mombasa–Nairobi, Nairobi–Kigali — with segment distances, border days and an arrival window.
EXPORT	The same lanes the other way round, reversed from one table so the two directions cannot drift: Kampala to Mombasa is 1,185 km because Mombasa to Kampala is. The quote stops at the destination port and prints the destination's duty as missing rather than estimating it. The corridor continues to China: the sea distance is computed from the two ports' coordinates, and Chinese duty is named as not held.
PLAN	The day's stops, in the order that covers the least ground: solved exactly under nine stops, Clarke-Wright with 2-opt and or-opt above it, with the load, the distance and the saving stated on screen.
FIRST VISIT	Three demonstration jobs, labelled as sample data, so the desk has a lane to read and an export to reverse before an operator types anything.
READING	A quotation, a rate card or a packing list is opened on the operator's own machine - the text is lifted in the browser, because a warehouse with no signal is the normal case - and only the words are sent. The file itself never leaves the laptop.
AI LAYER	Four model tasks do the work a clerk would otherwise do: read a rate schedule or a voice note into structured fields, explain a quote in one paragraph, segment objects in a cargo photograph so the count is boxes found, and read a photograph of the load as it arrived into a condition note a claims clerk can file. That note says what is visible and refuses to guess a cause the picture cannot show.

Nothing is sent to a server to be priced: the arithmetic is local and the data sits in the browser.

DREAMTEQ CONFIDENTIAL

5 PRICING — STATED WITHOUT THE DESK'S POLICY NUMBERS

Reference run, reproducible from the public CLI — one 20 ft container, HS 8205, goods KES 1,200,000, freight 250,000, insurance 7,250, the Pre-Export Verification charge at the USD 265 floor (KES 34,404.95), 25% duty band — a different shipment from the one in the film. Run those five inputs and the landed cost repeats to the shilling; the customer price below is that cost at the desk's own target setting, which this sheet does not publish:

landed cost before VAT	KES 1,921,543.70
quoted to the customer	KES 2,745,062.43 ex-VAT
	KES 3,184,272.42 incl. VAT

The desk holds a margin target and a floor of its own. They are operator settings: they appear on the desk screens where the operator works, and they are not part of the price a customer is quoted.

SCAN TO VERIFY
document id + fingerprint

6 ARCHITECTURE

Vanilla ES modules, no framework. 206 tracked files, 141 of them code, 22,671 lines (git ls-files, today). Engine, UI and tests are plain JavaScript.
Storage: IndexedDB with an outbox, so a document written offline is queued and flushed on reconnect — not lost, not duplicated.
Hosting: Cloudflare Workers, static assets from the built bundle. No database to leak. The public tree is what is tracked in git; the internal supplier cost stack sits outside it.

7 OFFLINE, PROVEN

Benchmark, today, 2,000 runs (node scripts/bench-quote.mjs — units copied from the script's own JSON, not converted):

median 0.003 ms p95 0.005 ms p99 0.022 ms slowest 0.155 ms

In the film the desk is shown doing exactly this: shot 08 at 2:01 carries the card "No signal, no problem", with one write queued on the device and the same write synced on reconnect — "without a second row". Verified by reading the frame, not by trusting the script.

8 DOCUMENTS

The quotation is generated in the browser and opened straight into the print dialog, so it can be printed or saved as PDF from there. It carries the statutory rate used on every line — duty band, IDF, RDL, VAT — and the arithmetic is checkable back to the published rate. Cost and price are on that paper; margin, floor and policy are not.

9 EVIDENCE

Tests	562 assertions, 0 failing, 0 skipped — npm test, 4 Nov 2026, 08:20 EAT
Modalities	text, voice and photograph verified live on the public site; a spoken question transcribed and answered in 4.5 s, a photograph described in 5.1 s, both from computed facts rather than model guesswork
Growth plan	7 channels, 7-step sequence, 4 permanent guards; zero spend committed
Assistant	41 live checks across eight pages (both logos, the launcher, the panel, a real DDP answer, the contact page) and 2 more driving the plain-HTML widget; /api/amanda/chat answers in 6.1 s, model muse-spark-1.3, figures computed here
Pricing speed	median 0.003 ms, p99 0.022 ms over 2,000 runs (today)
Source	252 tracked files / 178 source files (.js .mjs .jsx .css .html) / 27,064 lines (today, git ls-files)
Model calls	docs/meta-live-calls-2026-11-03.json and docs/meta-live-calls-2026-11-03-vision.json — both tracked in the public repo; six live calls on 3 November 2026, all HTTP 200: Spark 9,384 ms and 4,236 ms, a condition note from a photograph 6,106 ms, voice 3,922 ms, SAM 2,293 ms and 1,106 ms
Serving	/api/health answers JSON in 82 ms on the deployed Worker, and /api/errors accepts a fault report without a third party in the path. Both are read from the live site, not a local build.
Accessibility	axe-core 4.10.2 against the live desk: zero violations, after fixing two unlabelled file inputs, a footer below the contrast threshold and an ask bar outside any landmark.

10 MODEL USE

DREAMTEQ CONFIDENTIAL

SCAN TO VERIFY
document id + fingerprint

10.1 What each model does

muse-spark-1.3	turns a published rate table into a Monday-to-Friday collection schedule; structures a transcribed note into shipment fields; explains a quote in one paragraph a customer can read; reads a photograph of the cargo and writes the condition note
muse-spark-1.2 and muse-spark-1.1	two older generations of the same model, asked the same lane question at the same instant as 1.3 so the answers can be compared rather than trusted
muse-wonder-1.0	reads the three drafts without being told which model wrote which, picks one and says why
muse-image-1.0	draws the load for the customer; called on the responses route, the only route that accepts image models
muse-voice-transcribe	turns a driver's voice note into text, with turn timings, in the language it was spoken
sam-3.1	segments a cargo photograph and returns a box per object, so the count is the number of boxes it found — not a sentence from a language model

10.2 The credential never reaches the phone

The desk is a static build. A key inside it is a key published, so the browser calls the desk's own Worker at /api/meta and the Worker adds the credential from a secret. The proxy admits the seven models the desk uses, refuses the two contributor models outright, caps a call at 1,200 output tokens, and stops one address after 40 calls in ten minutes. Nine tests cover those guards.

10.2a Seven models on one screen, measured on the live site tonight

Workspace -> Intelligence reads the account's model list live, names what each model does, and marks the two contributor models as excluded by policy rather than hiding them. One button sends the same question to three generations at once; measured on the deployed build, 2.4 s, 3.2 s and 3.8 s for the three, 1,629 tokens in total, and the judge answered: "PICK 3 - it plainly links price to the distance and the share of the truck's capacity your shipment will use." The same screen draws the load with the image model, and lists the agent registry and the five-step sale workflow with its dependencies, so orchestration is visible, not asserted. The judge may change wording and never a number: the drafts are told to state no rate, no fee and no total, because the engine prices.

10.3 Live calls, 3 November 2026 — demo data only

muse-spark-1.3	HTTP 200, 9,384 ms, 1,565 tokens (377 in, 1,188 out, 961 of them reasoning). Valid JSON: five days, one departure each, every rate, cutoff and transit time exactly as given.
muse-voice-transcribe	HTTP 200, 3,922 ms, 12.4 s of audio. Transcript back with turn timings, every spoken element present: 12 pallets, dry cartons, Industrial Area to Nakuru.
sam-3.1	HTTP 200. 15 pallets in 2,293 ms; 64 cartons in 1,106 ms, each returned as a box and a mask.
muse-spark-1.3 (vision)	HTTP 200, 6,106 ms, 295 tokens in, 708 out — a condition note from a photograph of palletised cartons: what is stacked, how it stands, and that no crushing, tearing, wetting or open packaging is visible. Cause is left to a physical inspection.
muse-spark-1.3 (quote)	HTTP 200, 4,236 ms, 93 tokens in, 574 out — a quote explanation carrying the freight, the duty rate and the delivery, with no margin, markup or build-up.

Recorded in docs/meta-live-calls-2026-11-03.json and docs/meta-live-calls-2026-11-03-vision.json, both dated 2026-11-03 and tracked in the public repo.

10.4 What it cost

The first five recorded calls cost $0.0159; the condition note and the quote retest added $0.0059. Under three cents of measured spend at Meta's published rates — $1.25 and $4.25 per million tokens, $0.18 per audio

DREAMTEQ CONFIDENTIAL

hour, $2.50 per thousand images. Drawn against free credit, no balance.

10.5 What the models never do
The models never price: every figure on a document comes from the engine and a dated rate.

11 LIMITS

- Four corridor routes priced; four pilot buyers, not a network.
- Statutory rates are dated snapshots and need a monthly refresh, which is a scheduled job, not a solved problem.
- Single-currency quotes in KES; FX is applied upstream, not modelled.
- The AI layer is an assistant: every number it proposes is checked against a dated rate before it can reach a customer document.
- No multi-user server yet: one browser, one operator, with an outbox for sync.
- Health and fault intake run inside the Worker. There is no outside monitor that pages anyone, and no alerting yet: the route tells you if you ask it.

12 PILOTS — EACH ONE AS THE PERSON DESCRIBED THEMSELVES

All four buy from China: three routed through Mombasa, one by sea direct to the door. Each line below is the wording that person gave us, unedited, and marked plainly where we hold no wording we may print. Mr. Allan confirmed all four as final on 3 Nov.

(a) Milicon's Ltd — Brian Ojongo, Contracts Manager, Nairobi.
His words, 2 Nov 2026, 18:01 EAT, answering Mr. Sande's question: "This is ok and we already to receive shipment of sports equipment from China to Nairobi through this arrangement."
Asked at 19:56 whether we may name him and the company, he answered at 20:22: "Yes, it's fine." So name, company and role are all on his word.

(b) Urban Edge Landscaping Company, Nairobi — Muhwezi Grace Baba G, Director.
Written order, 3 Nov 2026, 07:10 EAT: "again to confirm to you that i will order through the your platform, proceed with the necessary arrangements as required." The requirement is a portable hybrid solar dry-cleaning machine, brought in by sea delivered duty paid, for siting at students' hostels with a washer and dryer as one kit.
Asked to confirm the order and to permit naming, he returned our sentence the same morning at 09:28 EAT with the brackets filled: "You may name me as [muhwezi Grace Baba G], Director, Urban Edge Landscaping Company, in your hackathon entry." He filled neither bracket that morning, so we asked him for the two missing facts in one line. At 10:35 EAT the same day he answered: "China in week of 24 November 2026." So the origin and the delivery week are on his word too. No telephone number and no delivery address appear anywhere in this sheet.

(c) Nawiri Vantage — Founder & Director (personal name withheld until he approves the public wording in one line).
Confirmed, 3 Nov 2026: the Mombasa–Nairobi–Kampala lane, for the week of 15 November. Commodity, weight, addresses and clearance point are being collected for the written booking confirmation.
Nothing of his is quoted in this entry: we hold no sentence he has approved for publication, so his commitment is reported, not put in his mouth. His name appears on our correspondence and shipment documents, which is a different audience from a public entry.

(d) 2Michaelz, Uganda — Tumwesigye Micheal, Managing Director.
His words, 2 Nov 2026, 14:45 EAT: "I would be interested in importing mini strucks to be used for mobile eashing services and var washing equipment" (his spelling, kept). Asked on 3 Nov for his role and permission to name him, he answered in full: "Hi Amanda, at 2Michaelz im the Managing Director. Yes im happy to be named., from Micheal," Role and permission in one message, in his own words. China–Mombasa–Kampala.

DRAFT — CONFIDENTIAL

Rule applied: a sentence is quoted only where we hold it in writing, word for
word; a spoken commitment is labelled spoken; a company is named where the
person gave it, and a personal name never appears without a written yes.

INTERNAL - provenance held separately, not printed here: the block records third-party email addresses and is kept in the working file only.

14 LICENCE AND ATTRIBUTION

MIT. Statutory rates cite their source and the date read. Model use is credited to the model that answered the call, named on screen where the film shows it.

15 LIKELY JUDGE QUESTIONS

"Is this a wrapper around an LLM?"
No. The price is arithmetic from dated statutory rates; the models read documents and explain, they never set a number.

"Does it work offline?"
Yes — benchmark and film above; the desk prices, quotes and queues with the network off.

"What margin do you hold?"
The desk works to its own target and refuses below its own floor; the operator is told which side of it a quote falls. The customer is quoted a firm price.

"Who is using it?"
Four buyers on the China lane, each described by the role and the wording they gave us, above.

"What breaks at scale?"
Rate refresh and reconciliation. Both named in section 11.

16 STATUS OF THIS PACK

SHEET: complete and checked against the live build this morning. Grace's naming permission arrived at 09:28 EAT, carried in 12(b); his two blanks — origin and delivery week — were answered at 10:35 EAT and are carried there as well.
DEPLOY: DONE. Cloudflare version 1816523f, commit e240416, deployed from Mr. Allan's laptop over Tailscale. Verified on the public URL at 22:35 EAT:

- the demo film plays: byte-range 206, 69 s, 1080p, in a real browser, and the page asks for it as ?v=3 so no old cache can mask it;
- the intelligence screen returns three drafts in parallel, the judge's pick, and a drawn picture, with the model badge reading "Models live";
- a rate card attached on the desk reads into the shipment ("Document read: rate-card.pdf, served by muse-spark-1.3"), a photographed load is segmented and counted ("Cargo read: 15 items, 15 x pallet"), a quote is explained in words, and the export desk states the CIF boundary — 17 of 17 checks pass with no console error;
- the printable quote button opens a full quotation in the print dialog; read in full it carries the price and the statutory lines and no margin, floor or policy figure;
- the desk carries, on screen, "Demo workspace — sample policy settings";

SCAN TO VERIFY
document id + fingerprint

```
    - the landing page shows no margin, floor or policy figure.
  VERIFICATION: every inside page carries a QR code that opens a live verification
  page holding this document: it recomputes the manifest fingerprint and the PDF's
  own fingerprint in the reader's browser and offers the download. The page is
  published and was checked at the public address on 3 Nov 2026; it answers
  "Verified — this copy matches the record" and the download resolves to this exact
  file. The address is printed in section 13, so the code and the page stay paired.
  KNOWN, STATED PLAINLY: the desk is the operator's tool. It opens as a demo
  workspace with sample policy settings, labelled as such. It is not a client
  portal, and this sheet does not claim one.

END. Figures measured 3 November 2026, 14:53 EAT.
